

A Tiny Paper Built by Make

Missing Semester — Metaprogramming exercise

July 6, 2026

1 Introduction

This document exists to demonstrate a real build system. The figure below is generated from `data.dat` by `plot-data.py`; the PDF is produced from this `.tex` source. `make` wires the dependency chain together so that touching either the data or the plotting script rebuilds only what is necessary.

2 Results

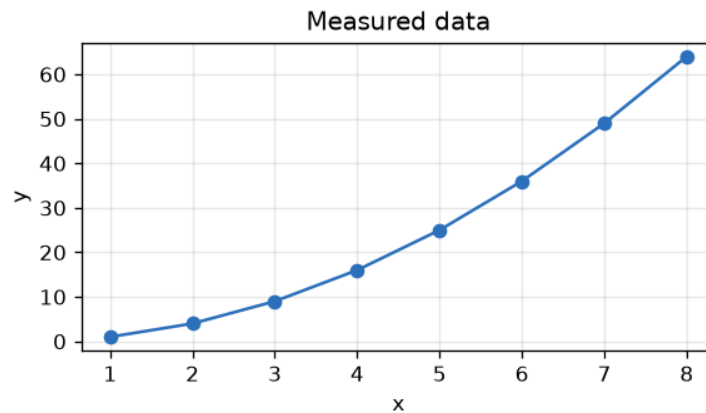

Figure 1: Data plotted by the build pipeline.

3 Conclusion

The build is fully described by the `Makefile`: `paper.pdf` depends on `plot.png`, which depends on `data.dat` and the plotting script. A `clean` target removes every generated artifact.
